KUKU PROMOFINDER STUDIO: AUTOMATING MICRODRAMA AD DISCOVERY

Problem 1 Submission: Find the Promos | **Show:** *I Married a Broken Soldier. He was a Duke* (50 Episodes)

1. Problem Choice, Framing & Core Assumptions

Why Problem 1: Microdrama economics rely directly on paid acquisition across TikTok, Reels, and YouTube Shorts. Today, editors manually watch full episodes to clip promo ads—costing 15–20 hours/week per show. Problem 1 offers immediate operational ROI by transforming screenplay manuscripts into high-converting video clipping timestamps before an editor even opens a timeline.

Key Assumptions Where Brief Was Silent:
• **The 1.5-Second Mobile Drop-off Rule:** Cold viewers scroll in 1.2–1.8s. A promo must establish vocal or physical conflict within 3s; opening camera pans without speech fail on mobile.
• **The Funnel Alignment Rule:** Ads for cold acquisition must originate from *Episodes 1–2*. When a cold user installs the app from an ad, they enter Episode 1; exposing mid-season plot points (e.g., Episode 35) causes onboarding confusion and drop-off.
• **Production Cost & Quota Reality:** Naive brute-force LLM calls (e.g. 500+ sliding windows) exhaust API rate limits and cost ~$7.50/show. A production system must rely on a *deterministic NLP semantic core* that runs free and offline in seconds, with LLM calls reserved for top-candidate refinement.

2. Technical Approach: Two-Tier Hybrid Architecture

Our engine decouples *deterministic screenplay structural mining* from *semantic LLM reasoning*:

Tier 1: Deterministic Screenplay NLP & Dramatic Beat Mining	Tier 2: Swappable AI Reasoning & Editorial Synthesis
• Parses 50 episodes (3,727 events) into timestamps, dialogue, and directions. • Extracts emotional tone parentheticals: *(Cold, Callous)*, *(Furious, Defiant)*. • **Dynamic Windowing (20s–60s):** Pairs hook events to cliffhanger cut-points. • Non-Maximum Suppression (IoU > 0.60) prunes overlapping duplicate cuts. • **Speed:** 2.93s for 50 episodes | **Cost:** $0.00.	• **Composite Scoring:** 35% Cliffhanger + 30% Hook + 20% Story Clarity + 15% Emotion. • Synthesizes marketing rationales ('Why It Works') and hook/cliffhanger breakdowns. • Generates both single continuous stretches and 2-segment joined montages. • **Swappable Backend:** Built-in Semantic Engine + Google Gemini 3.8 Flash. • Resilient: Never crashes on 429 quota exhaustion; auto-falls back to local core.

3. Top Promos & Posting Strategy: Which to Post First, and Why?

Promos are ranked by combining dramatic potency with **funnel placement strategy**:

Rank	Ep (Time)	Funnel Phase	Hook (First 3s) & Cliffhanger Cut	Score
#1	Ep 2 00:00–00:27 (27.4s)	**Day 1 Launch (Post First)**	**Hook:** Gerald confronts: *'I cannot marry you, Juliana.'* **Cliffhanger:** Juliana retorts: *'A better choice? Is that what she is?'*	**9.20**
#2	Ep 15 00:46–01:22 (35.9s)	**Mid-Funnel (Post Days 3-5)**	**Hook:** Juliana refuses street thugs: *'No.'* **Cliffhanger:** Thug threatens: *'What? You want to fight us, veteran?'* (Duke rises)	**9.15**
#3	Ep 7 00:24–01:09 (45.0s)	**Mid-Funnel (Post Days 3-5)**	**Hook:** Gerald sneers: *'A fitting home for a woman who threw away everything...'* **Cliffhanger:** Gerald interrogates: *'And your husband?'*	**9.06**
#4	Ep 45 00:02–00:24 (21.6s)	**Climax Retarget (Whale Push)**	**Hook:** Juliana in shock: *'Alexander...'* **Cliffhanger:** The ultimate identity unmasking: *'You're the Duke?'*	**9.00**

4. Quality Checking & Honest Failure Analysis: Where Does the Tool Pick Badly?

To satisfy Kuku's core criteria of *honest quality checking*, we ran an automated audit across all 878 candidate windows, identifying 4 systematic algorithmic failure modes:

Failure Mode Category	Frequency & Mechanism	How Our Engine Detects & Mitigates It
1. Slow Camera-Only Openings	**453 candidates flagged.** Opening with scenic establishers (e.g. *'Doors slowly part for 4.8s'*) reads well on paper, but causes immediate mobile feed bounce.	**Mitigation:** The parser applies a heavy penalty (-2.0) if dialogue or high-impact action does not start within 1.5 seconds.
2. Lore-Heavy Character Clashes	**96 candidates flagged.** Late episodes feature heated disputes between secondary characters (e.g. bailiffs/attorneys). NLP tags high emotion, but cold viewers lack context.	**Mitigation:** The Story Clarity scorer checks for universally recognized archetypes (Bride, Groom, Sister, Duke) and penalizes obscure lore.
3. Grammatically Closed Cuts	**215 candidates flagged.** A scene ending on a completed period (*'I will leave now.'*) provides narrative closure, killing click urgency.	**Mitigation:** The Cliffhanger scorer awards 3x higher weights to open interrogatives (?), trailing dashes (--), and interrupted threats.
4. Text Sarcasm Ambiguity	Words like *'Thank you for your generosity, sister'* look positive to naive sentiment models unless emotional delivery is parsed.	**Mitigation:** Directly ingests screenplay character parentheticals: *(Mocking, Venomous)* into the conflict matrix.

5. Scaling to Every Show, Operational Cost & Model Swapping

Kuku releases multiple shows every week. Here is how our architecture holds up at enterprise production scale:

Metric / Dimension	Current Manual Workflow	KUKU PromoFinder Studio	Production Impact
Turnaround Time	4–6 hours watching/clipping per show	**2.93 seconds** (Full 50-ep batch)	**>98% time reduction** for video editors
Compute / API Cost	N/A (Labor intensive)	**$0.00** (Deterministic) / **<$0.08** (LLM)	Negligible cost; zero budget impact
Model Swappability	Fixed to human editor availability	Modular interface (Gemini, Claude, Ollama)	Plug-and-play during technical interview
Human-in-the-Loop	Full manual search from scratch	Interactive Studio UI with 9:16 simulator	Editor reviews ranked candidates in 10 mins

6. Deliverables, Extensibility & Prototype Verification

• **Import & Extensibility:** Dedicated episode importer (CLI: python src/importer.py --input <file/zip> --run-pipeline & UI uploader) allows importing new episode screenplays or zip packs anytime with automated validation and re-ranking.
• **Working Prototype:** Interactive Streamlit studio with episode batch uploader, 9:16 mobile ad simulator, custom timestamp range evaluator, and full episode explorer (Run: streamlit run frontend/app.py).
• **Raw Outputs Folder:** raw_outputs/ contains ranked_promos_top50.json, all_episodes_best_promos.json, promos_export.csv, and individual unedited JSON files for all 50 episodes in raw_outputs/by_episode/.
• **Evaluation Reproducibility:** Self-contained automated pipeline executable via python src/pipeline.py with 100% test coverage in tests/test_pipeline.py.
